ShoutBox

What is it... a website where multiple people can write short messages which are stored and published.

We need to build a system where people can share shouts (**posts**) and images across the network, for which you can relate it with Facebook, Twitter, LinkedIn, etc. So let's have a brief overview about the system, where it consists of two roles:

1. User
2. Admin

Users:

1. Have to register.
2. Can upload shouts as text, images, audio, videos.
3. Can accept/ reject the invite of other users and make friends.
4. Friends can only see the shouts.
5. Can remove already made friend.
6. Can report any shouts.
7. Comments on the shouts(Optional).

The User facing application should be developed using Angular/React at front end and REST APIs using Laravel framework at backend.

Admin:

1. Have to approve the registration request of users.
2. Can delete shouts of users.
3. Can delete users.
4. Can delete reports shouts.

The Admin facing application should be purely developed using Laravel framework, without Angular/React

Software Requirements:

- PHP
- Laravel Framework
- MySQL
- Front End :
 - SASS
 - CSS3
 - Bootstrap
 - Angular/React
 - RWD
 - Bootstrap
 - Unit Testing with Jasmine + Karma
